

Enterprise

Controlling multiple locations is easier with QS/1®'s Enterprise configuration. One server at your corporate office hosts up to 256 separate store locations. Plus, your corporate IT staff can manage your data and provide centralized backups, data maintenance and multiple security levels. Lower your communication costs with a single communication line from your server to QS/1's PowerLine™ for claims transmission. With Enterprise, you can choose from a variety of configurations each designed to meet the differing needs of your store locations. One option might be a non-shared environment where no data is shared between the store locations. Each store can operate on a different software release so they can upgrade when they're ready. Another option is a shared environment giving you the ability to easily share drug and physician information or transfer prescriptions between stores. Synchronize data to keep all stores current. All software and server updates only need to be installed once on your corporate office server.

System Features

Data Management

- Manage up to 256 stores from one central location
- Maintain data centrally for comprehensive control
- Eliminate back-office computer tasks from your stores or locations
- Reconcile claims from your central office
- Share customer, physician and clinical data among all locations
- Maintain separate files for each store
- Multiple security levels provided to ensure confidentiality
- Protect data from loss with centralized backups
- All management of data, clinical updates, program updates and file maintenance can be done by your central office IT personnel
- Install software and server updates once on your central office server
- Connect up to 12 printers to each virtual server
